Use of Artificial Intelligence in the Project

During the development of the **Slots Pages** plugin, artificial intelligence was used in a limited and focused way, strictly for secondary support tasks. All core code, logic, and plugin architecture were manually developed.

Where AI Was Used (ChatGPT)

Area	AI Contribution
Documentation	Initial draft of parts of the README
Naming Conventions	Suggestions for readable and consistent names
Code Snippets	Quick validation of syntax and hook usage
Sync Proposal	First draft that was later adapted manually

Where AI Was Not Used

- Core plugin development (custom post type, meta fields, shortcode, blocks, queries)

- Frontend rendering and logic implementation

- Integration with WordPress editor and Gutenberg support

- Plugin testing on fresh installations

- Styling override structure and multisite customization logic

Conclusions on the approach

AI was used solely to streamline minor and repetitive tasks. Every suggestion was reviewed, validated, and adjusted to ensure full alignment with project requirements and coding best practices. The development remained fully under manual control.
